TUTORIAL

Exporting Program

This tutorial tells you the steps to export a program from your Grasshopper script and prepare it for the UR30 robot.

01 Open the text editor

Open a Notepad++ application or some other basic text editor

02 Test Simulation on Grasshopper

Ensure the simulation is working in Grasshopper and that there are no conflicts between the robot and itself and the robot and the bed.

03 Copy program text from Grasshopper

Copy the text from the program: it should be on a note in Grasshopper - right click on the note and copy. Do this twice to ensure it is copied.

04 Paste text to text editor

Paste the text from the program into your text editor

05 Edit program

Remove the first and last line of the program. E.g. the line that says "def Program():" and the line that says "end".

06 Save program as .script

Save the program as a .script file (choose .txt but do not append the .txt). You may also change the program to a .script file after exporting as a .txt file.

WARNING Safety First

This template is not a substitute for a task-specific risk assessment. Confirm e-stop locations, safety-rated I/O, and speed/force limits for this application before publishing any tutorial built from it.

SECTION 04

Appendix & Glossary

Glossary

TCP	Tool Center Point — the reference point on the end-effector the robot controls in space.
PolyScope	The touchscreen operating system running on the UR teach pendant.
Waypoint	A saved robot pose used within a program's motion sequence.
Teach Pendant	The interface screen attached to the robot where you enter commands.
